Trusted runtime truth for agentic IT

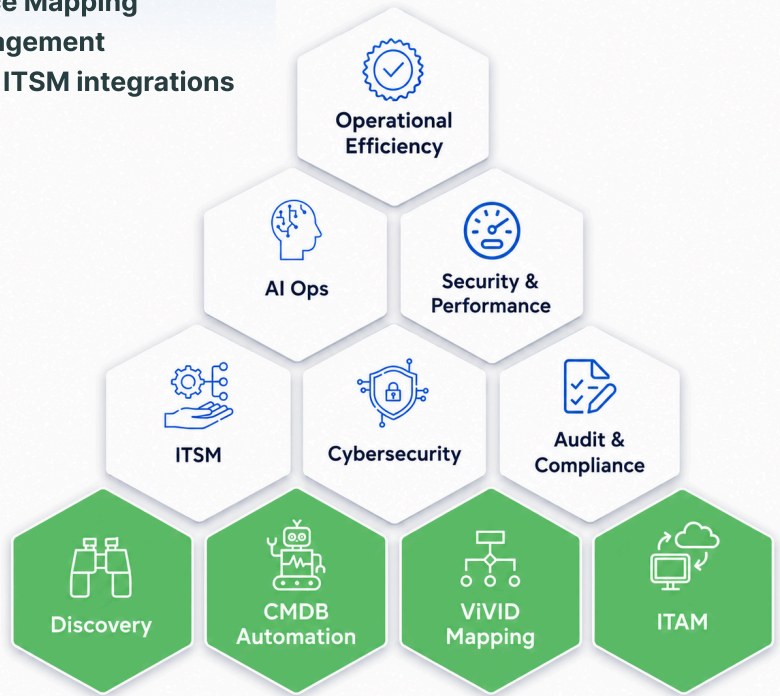

VIRIMA HIGHLIGHTS

- Truth layer for Teams and AI
- Hybrid IT discovery
- Multi-source CMDB
- ViVID™ Service Mapping
- IT Asset management
- Bi-directional ITSM integrations

YOUR FOUNDATION FOR AI & IT SUCCESS

Virima delivers trusted runtime truth for agentic IT — live, authoritative context about what exists, how it's connected, what changed, and what could break — so IT teams and AI agents act safely and decisively.

Virima's hybrid discovery, live CMDB, ViVID™ service mapping, and ITAM give operations, infrastructure, and asset management teams the verified data they need to resolve incidents faster, reduce failed changes, and govern every action.

THREE PILLARS OF RUNTIME TRUTH

Discover with Authority

Attribute-level authority from multi-source discovery — with source traceability and conflict resolution.

Understand in Context

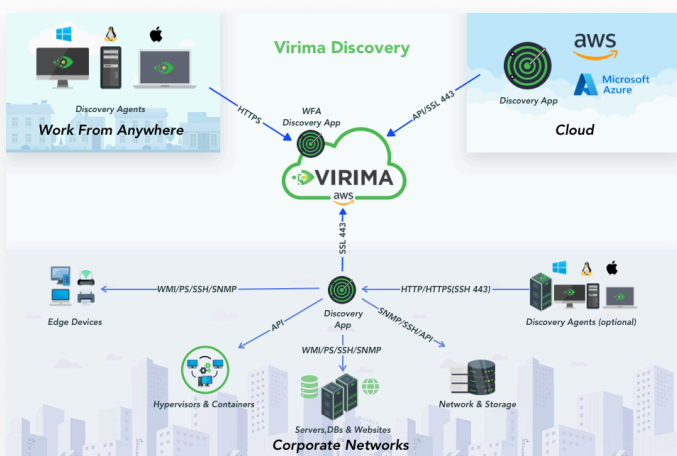

Assets connected to services, dependencies, ownership, blast radius, and change history — before any decision.

Govern Every Action

Explainability, change approval workflows, role-based access, and auditability — so every action is backed by verifiable discovery data.

HYBRID IT DISCOVERY

Flexible multi-protocol discovery with attribute-level authority, full source traceability, and conflict resolution.

AGENTLESS DISCOVERY

- Credentials stay local, encrypted, and secure
- Discovery across physical, virtual, cloud and edge
- API support for cloud, hypervisors, and more

DISCOVERY AGENT

- Optional for Windows, macOS, and Linux
- Persistent monitoring of configuration changes
- Work-From-Anywhere device monitoring

AUTOMATED CMDB

Live, reconciled configuration records populated from multi-source discovery — so asset records, CI data, and service context are always in sync.

- No-code bi-directional integration with ITSM platforms
- CMDB health scoring and source conflict resolution
- Granular business rule automation for CMDB maintenance
- Visualize CI relationships and service maps directly in the CMDB

VIVID™ SERVICE MAPPING

ViVID™ builds dynamic, visual maps of your business service dependencies and infrastructure relationships — sourced directly from discovery data.

ITSM overlays of incident and change records — plus vulnerability context from NIST NVD lookups at no extra cost — give every team live blast-radius context before any action is taken.

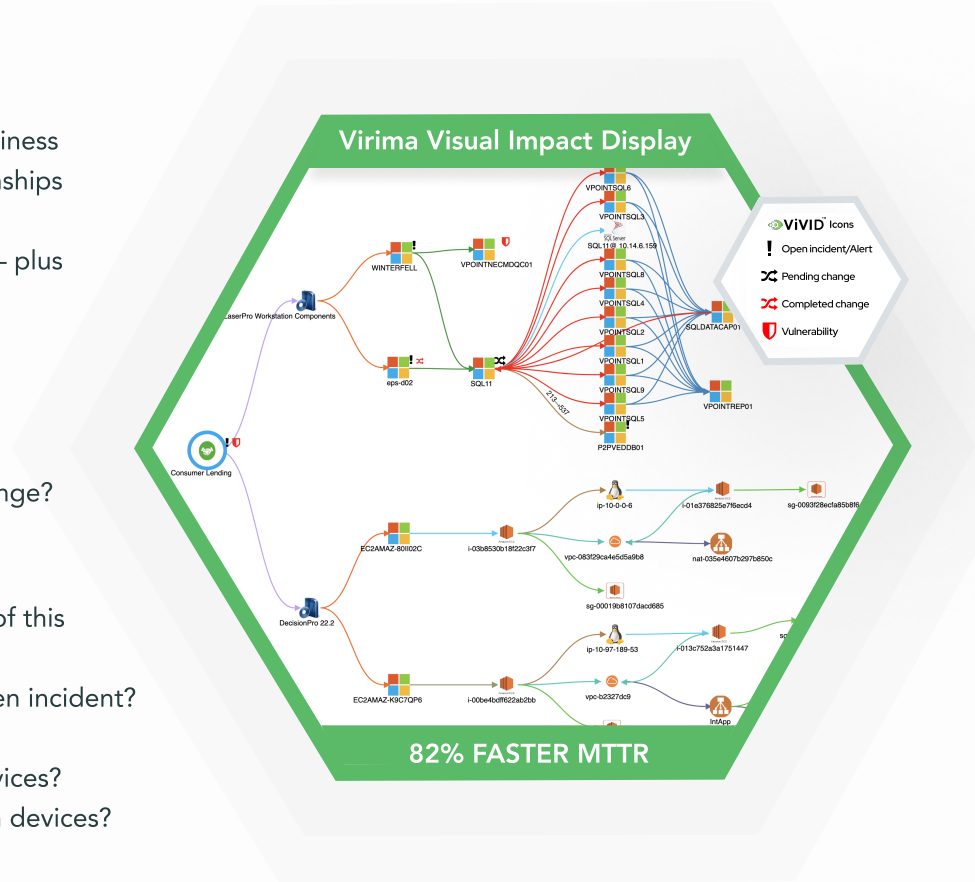

ViVID™ answers:

- What is the risk exposure to making this change?
- Who are the stakeholders to this change or incident?
- What recent change may be the root cause of this service outage?
- What services could be impacted by this open incident?
- Which critical assets have vulnerabilities?
- Where are the weak links in my business services?
- Which CIs are communicating with unknown devices?

IT ASSET MANAGEMENT

Track what exists, who owns it, what it costs, and what lifecycle state it's in — verified, governed, and ready to act on.

- Hardware and software lifecycle — from procurement to decommission
- License compliance and usage metering
- Certificate management
- Financial visibility — cost, depreciation and budget exposure
- Automated reconciliation with CMDB records

TRUST & SECURITY

SOC 2 Type 2 CERTIFIED

SO/IEC 27001:2022 CERTIFIED

Move faster. Act safely.
